

Setup for Suricata-Dashboard

📅 Date	July 23, 2026 → July 24, 2026
🔗 URL	https://github.com/Sameeha135/suricata-dashboard.git

- Installed VsCode on ubuntu
- Set up github etc.
- Set up venv and installed packages:

```
# 1. Create the virtual environment  
python3 -m venv venv
```

```
# 2. Activate it  
source venv/bin/activate
```

```
# 3. Install your required packages  
pip install streamlit streamlit-autorefresh pandas
```

▼ Setup

- `sudo apt install python3-pip python3-venv -y` — installs pip (Python's package installer) and the venv module (lets you create isolated Python environments so this project's packages don't clash with system Python).
- `python3 -m venv venv` + `source venv/bin/activate` — created and activated a virtual environment called `venv`. You'll need to run that `source` command every time you open a new terminal to work on this project.
- `pip install streamlit streamlit-autorefresh pandas` — installed Streamlit itself, the autorefresh helper, and pandas (which you'll use to load `eve.json` lines into a filterable table).
- `git config/git init` — sets you up to version-control this new dashboard separately from the old Flask/Vue one, which is the right call since this is a fresh project.
